Scriptel mSign Software

Scriptel mSign is a signature capture application for Android and iOS mobile devices, and Web browsers. Signatures can be captured and used to sign in any Scriptel-integrated application, such as our plugins for Adobe PDFs, Microsoft Word and Excel, OpenOffice Writer and Calc, our add-ons for Google Docs and Sheets, and software from third parties.

mSign acquired signatures contain all the data normally captured from ScripTouch signature pads, along with an enhanced mode that supports color, different resolutions, sizes, and aspect ratios. More than one mSign Mobile device can be connected to an mSign Desktop with each device encrypted in a way that cannot be decoded by the server.

Signatures are encrypted and routed to any registered mSign Desktop through Scriptel's pairing server. Organizations that want to keep the signing process entirely under their own control can purchase a license for mSign Server.

Software Key Features

Scriptel mSign consists of three components:

mSign Mobile

- Connects to Scriptel-integrated software as a physical Scriptel ScripTouch Compact LCD ST1550/ST1551 signature pad.
- Android, iOS, and Web browser support
- Standard and Enhanced modes
- Enhanced mode supports features beyond normal ScripTouch devices (color, different resolutions, sizes, and aspect ratios).
- End-to-end encryption
- Connects at USB level.

mSign Desktop

- Pairs with mSign Mobile device through the server.
- Pairs using text input or QR code.
- Monitors connection status.

mSign Server

- Available to customers who want to self-host.
- Supports additional capacity by adding servers in potentially different geographic regions.
